

Evolution Extended

Biological Debates on the Meaning of Life

edited by Connie Barlow

MIT Press, 1994

301 pp., 75 illus.

\$24.95 cloth

"This unique anthology of 39 major selections explores the basic issue and disparate interpretations of science, philosophy, and theology regarding evolution. The topics covered include complexity, diversity, contingency, dominant types, symbiosis, and mass extinctions; evolutionary worldviews ranging from Darwinian materialism to Teilhardian mysticism are discussed. Special attention is given to a critical examination of chance and necessity and to the alleged teleology (progress, purpose, direction, and end-goal) in organic evolution. Of particular significance are excerpts from Julian Huxley, Jacques Monod, William Provine, and Edward O. Wilson. Entries on the present Gaia hypothesis and the ongoing controversy between fundamentalist creationists and scientific evolutionists make this book relevant as well as informative and provocative. Enriched with poems, illustrations, editorial comments, and copious references, this is recommended for all academic and public library evolution collections."

—*Library Journal*

"Barlow's selection is broad-ranging and well-balanced . . . As with all the best anthologies, if you dip into it you often find something surprising. [The deep division between science and the rest of our culture] is the rift that Barlow, in this and her anthology *From Gaia to Selfish Genes*, is attempting to put bridges over. Good luck to her."

—*New Scientist*

"a readable, thought-provoking collection of excerpts"

—*Booklist*

"A variety of meanings can be drawn from the theory of evolution, stretching to pertain to life on earth and its relationship to the universe, issues of progressive versus historical evolution concepts, and relationships between evolutionary theory and mankind's progression. Barlow edits a fine series of surveys which provides historical and scientific insights on the issues surrounding evolution, blending essays, poetry, and art in a philosophical/science survey."

—*Midwest Book Review*

"I am convinced that the story of the universe that has come out of three centuries of modern scientific work will be recognized as a supreme human achievement, the scientific enterprise's central gift to humanity, a revelation having a status equal to that of the great religious revelations of the past."—*Brian Swimme*, as quoted in *Evolution Extended*.
